

State-of-the-art technology for patients.

The campaign for a fluoroscopic c-arm machine.

Mercy Medical Center's imaging department continues to grow and see more patients. Fluoroscopy is a type of imaging that shows a continuous x-ray image, and is extremely helpful while performing procedures.

The need for a new fluoroscopic c-arm is crucial for patient care. The Cios Spin (c-arm) will replace our current 18-year-old system and offer modern technology and necessary upgrades, including:

- 3D technology for intraoperative imaging procedures
- Higher imaging penetration capacity for patients with dense tissue
- Pinpoints very fine structures such as implants, screws, and devices

This new c-arm will provide more certainty in demanding cases, and it's versatility makes it an asset for multiple departments.

Your help is needed to fund the purchase of a Siemens Medical Solution Cios Spin (c-arm) for our imaging department totaling \$450,000.
