

Magnetic Resonance Imaging - MRI

Giving matters.

The MRI suite at Mercy Medical Center performed 3,000 MRI exams in 2020.

Mercy Medical Center's current MRI scanner was installed in 2010. While our scanner is still serviceable, the new version has a much wider bore diameter (27.5 inches compared to our current 23 inches). This addition will allow greater patient comfort, the ability to accommodate larger patients, and the ability to offer MRI breast imaging.

- Larger bore accommodates more patients with less claustrophobia
- Newer imaging technology produces clearer images with additional information diagnostic

Having a second scanner for outpatient, emergency, and inpatient services will improve patient care and reduce utilization conflicts resulting in more efficient and higher quality care.
